

Energy Models

Overview of Energy Models

- ▶ Trend
- ▶ Time Series
- ▶ Guess based on experience
- ▶ Survey Based
- ▶ Scenario Planning
- ▶ I/O Models
- ▶ Energy Balance Models
- ▶ End Use
- ▶ Process Modeling
- ▶ Game Theory
- ▶ Experimental/Behavioral

Trend

- ▶ Uses only patterns of the past to make forecasts about the future.
- ▶ Cram a line through the data.

Trend Comments

- ▶ Regression with time as RHS variable. $Y = \text{time} + \epsilon$
- ▶ EC469 shows you how to do this.
- ▶ Not everything is a line. You sometimes have to transform the data, logs and such are common.
- ▶ Only uses the past.
 - ▶ I was 90 lbs at 15, 110 at 17, 130 at 18 and 220 at 26.
 - ▶ Today?
- ▶ People don't react to prices and there is no change in technology.
- ▶ That said, it works for a lot of things and works when you have little time.
- ▶ Plenty of energy modeling looks like this.
 - ▶ If you don't have the time, throw in a trend line.

Time Series

- ▶ Similar to trend only
 - ▶ May have $Y = ARMA(p, q)$
 - ▶ or include a trend $Y = time + ARMA(p, q)$
- ▶ EC 472 shows you how to do this.
- ▶ Most energy data has a trend to it, which must be included in the model.
- ▶ Best thought of as a refinement to the trend regressions with better treatment of residuals.
 - ▶ More accurate confidence intervals on existing data.
 - ▶ Slightly better with near-term forecasts.
- ▶ Same problems as pure regression on trend.
- ▶ If you have an extra few minutes, do this.

Guess based on experience

- ▶ Don't laugh, this works.
- ▶ Old hands make very good guesses based on experience.
- ▶ GDP even has components that are based on analysts best judgement.

Survey Based

- ▶ Book gives some examples.
- ▶ Ask a bunch of experts about their best judgement and summarize
- ▶ Often expanded as a Delphi Survey
- ▶ For comically bad forecast see “Results of the Delphi IX Survey of Oil Forecasts” California Energy Commission, 1997.

Delphi Surveys

- ▶ Ask each person in private for best guess.
- ▶ Compile results.
- ▶ Ask outliers why they said what they did.
- ▶ Give everyone:
 - ▶ The distribution of guesses for each parameter
 - ▶ The reasons the outliers gave for the answer they gave.
- ▶ Ask for another guess.
- ▶ Report the new distribution or repeat if desired.

Scenario Planning

I/O Models

- ▶ Old school – 1920s Leontief
- ▶ Has an equilibrium concept
- ▶ Assumes fixed ratios are used in production
 - ▶ No reaction to price changes
 - ▶ No reaction to input price changes
 - ▶ Constant returns to scale.
- ▶ Often seen as part of a computable general equilibrium model to shorten run-times. REMI and IMPLAN use it in regional economic models.
- ▶ Will not ask you to do one unless you want to.
- ▶ Book has an overly long explanation.

Walk Through I/O model

$$x_1 = \alpha_{1,1}x_1 + \alpha_{1,2}x_2 + d_1$$

- ▶ x_1 is how much of good one that gets made.
- ▶ d_1 is how much final consumers want of good 1.
- ▶ $\alpha_{1,1}$ the ammount of good 1 needed to produce good 1.
- ▶ $\alpha_{1,2}$ the ammount of good 1 needed to produce good 2.
- ▶ Each good has an equation
- ▶ α can be zero but there are restrictions on how many and where. The matrix needs to be invertable.

Matrix Form $x = Ax + d$ is solved as $x = (I - A)^{-1}d$

Energy Balance Models

End Use Modeling

Process Modeling

Game Theory

- ▶ Not a full all economy model but a tool used to deal with decisions where:
 - ▶ There is not a monopoly or monopsony.
 - ▶ Not perfect competition.
- ▶ Also used for:
 - ▶ Dynamic interactions of firms, think how gasoline prices go up fast but down slow.
 - ▶ Auction and bidding, technically mechanism design which is game theory backwards, to get people to tell the truth or do the right thing.
 - ▶ Basis for a lot of modern “regulation” which focuses on encouraging competition to reach goals.
- ▶ Probably did some in 201 or 311.

Experimental/Behavioral

- ▶ Admit that people and firms do not act rationally.
- ▶ Old school experiments run on people
- ▶ Field experiments are common in economics now
 - ▶ Esther Duflo received the Bates Clark Award 2010
 - ▶ Bluffstone in Econ is running two now in Ethiopia and Nepal.
- ▶ Typical Issues
 - ▶ Internal validity
 - ▶ Can you really connect cause to effect?
 - ▶ Did you avoid bias and control for everything?
 - ▶ External validity
 - ▶ Does it work in real life?
 - ▶ Does it work on other people?
 - ▶ Ecological validity
 - ▶ Did the experiment look like the real world?
